

DEV_GUIDE Addendum — Current Live Setup (Midas_V2)

*Purpose: Lock the *current* reality so we don't mix legacy JSON/TOML or re-invent scripts that already exist.*

1) Active Config Format & File

- Live config is JSON: **scenarios.json** (you sent the file).
- Location (typical): project root (or ./config). Use the checks below to confirm.

Sanity checks (one-liners):

```
PowerShell – list possible scenario files with timestamps: powershell -NoProfile -Command "Get-ChildItem .\config\scenarios.*, .\scenarios.* -ErrorAction SilentlyContinue | Select Name,Length,LastWriteTime | Format-Table -Auto"

Search which file the code actually references: powershell -NoProfile -Command "Get-ChildItem -Recurse -Include *.py,*.ps1 | Select-String -Pattern 'scenarios.json|scenarios.toml' | Format-Table Path,LineNumber,Line -Auto"
```

2) Scenarios Snapshot (from your scenarios.json)

Scenario	Key Parameters (abridged)
B (Baseline)	TP=2.0, SL=2.5, MACD=on, EMA=on(9), VWAP=on, gate=10, min_pm_vol=30k, price 1–20, gap 10–40
E (Dip Reclaim)	dip_reclaim=true, VWAP=on, EMA=on(9), MACD=on, gate=10, TP/SL=2.0/2.5, min_pm_vol=30k
D (current)	looser: MACD=off, SL=3.5, gate=0, min_pm_vol=0 (to be replaced with D_strict)

3) Planned Edit — Make D the Strict Profile (keep D_backup)

Replace the D block with this (JSON):

```
{ "D": { "params": { "min_pm_vol": 30000, "dip_reclaim": false, "tp_pct": 2.0, "riseBars": 2, "min_dip_pct": 2, "macd_confirm": true, "reclaim_pmh": false, "ema_period": 9, "sl_pct": 2.5, "gate_minutes": 5, "ema_confirm": true, "vwap_confirm": true, "min_reclaim_pct": 0.5, "reclaim_ref": "ema", "min_price": 1, "max_price": 20, "min_gap_pct": 10, "max_gap_pct": 40 } } }
```

4) Runners — Use What You Already Have

These exist and shouldn't be re-written unless broken:

- Single-day runner: `python scripts\run_day_simple.py --date YYYY-MM-DD --scenario B`
- All-scenarios wrapper (example): `powershell -NoProfile -File .\scripts\run_all_scenarios.ps1 -Date YYYY-MM-DD -Scenarios B,D,E`

Outputs typically land under ./out///results_.csv. Use your summarizer afterwards.

5) Tag the Milestone After Editing D

Lock the change with an annotated tag:

```
git add -A && git commit -m "Scenarios: make D strict (MACD on, gate=5, SL=2.5, 30k PM vol, price/gap bands)" git tag -a v0.3.2-scenarios -m "Milestone: Scenario D set to strict; B baseline; E dip-reclaim" git push && git push origin v0.3.2-scenarios
```

6) Aim (Remember This)

- Scenario B: stable ~60% WR target.
- Scenario D_strict: early filtered entries.
- Scenario E_dip: profit-factor booster.
- Optional: opening RVOL gate (short window) — not 30-day RVOL.
