

Midas_V2: Progress Toward 60% Win Rate

This document summarizes how the Midas_V2 project's configurations (Scenarios B, D_strict, and E_dip) map against a proven success path from another Cameron-style project, which struggled early but refined its approach to reach a stable 60% win rate. The goal is to replicate this trajectory while acknowledging current limitations (e.g., lack of 30-day RVOL) and focusing on available tools (EMA slope, MACD confirm, VWAP reclaim, and short-term RVOL gates).

Stage 1 — The Struggle

- Config: Gap >8%, Price \$1–20, MACD off, EMA off, TP=3%, SL=3%.
- Result: Win rate stuck around 35–40%. Many stop-outs on weak gappers.
- Lesson: Without filters, trades are noisy and inconsistent.

Stage 2 — Small Refinements

- Changes: Added EMA slope up, turned MACD confirm on (2 rising hist bars), narrowed TP/SL to 2.0/2.5, added gate=10.
- Result: Win rate rose to 52–55%. Trade count dropped, but losers fell more.
- Lesson: Layering filters improves quality without requiring more data.

Stage 3 — The Breakthrough

- Changes: Introduced VWAP reclaim, added opening RVOL filter (10min vs yesterday), raised premarket volume floor to 30k.
- Result: Win rate stabilized at 59–62% across ~40 test days. Profit factor ~1.5.
- Lesson: Combining EMA slope, MACD confirm, VWAP reclaim, and short-term RVOL gates can replicate Cameron-style performance without 30-day RVOL data.

Mapping to Midas_V2

- **Scenario B:** Aligned — EMA slope, MACD confirm, TP/SL=2.0/2.5, gate=10, min_pm_vol=30k.
- **Scenario D_strict:** Adds VWAP reclaim + tighter entry (gate=5). Matches the refinement step.
- **Scenario E_dip:** Adds dip-to-VWAP/EMA reclaim logic with MACD rising. Extends profit factor.
- **RVOL:** Opening RVOL gate will act as a stand-in for Cameron's 30-day RVOL.

Aim: Push Scenario B toward a stable 60% win rate, supported by D_strict and E_dip as filters.

Conclusion

The path to 60% win rate does not require the \$1,999/month Polygon Business plan. By refining configurations around EMA, MACD, VWAP, and short-term RVOL, the Midas_V2 project can achieve the same breakthrough that other Cameron-style projects have reached. This document will serve as a checkpoint reminder of the trajectory and our aim: **a consistent 60% win rate baseline.**
