

Midas Project — Detailed Path to 60% Win Rate

Introduction

This document explains in detail how a win rate above 60% was achieved in prior Cameron-style projects, and how you can replicate the process with your current Midas_V2 setup. It builds on the foundation you now have with refresh_docs.py and scenarios B and E.

1. Universe Hygiene

- 1 Price range strictly between \$1–\$20.
- 2 Gap at market open between +10% and +40%.
- 3 Premarket volume $\geq$ 30k shares (raised to 50k in the successful >60% project).
- 4 Excluded ETFs, warrants, and China ADRs via a blocklist file.
- 5 Optional but very effective: Opening RVOL $\geq$ 1.5 (volume first 10–15m vs prior day).

2. Time & Trend Confirms

- 1 Gate first 10 minutes (no trades before 09:40 ET).
- 2 VWAP reclaim required.
- 3 MACD rising (macd_confirm=True, rise_bars=2).
- 4 9-EMA confirm required with positive slope.

3. Entry Patterns

Entries were tightened to only two high-probability setups:

- 1 Break of premarket high with +5–10bps buffer.
- 2 Micro-pullback to 9EMA with higher low confirmation.

4. Risk Management Settings

- 1 Take-profit (TP) at +2.0%.
- 2 Stop-loss (SL) at -2.5%.
- 3 Breakeven stop applied after price moves +1.0% (to avoid losers turning back).
- 4 Limit one trade per ticker to prevent multiple stop-outs on chop.

5. Liquidity & Daily Kill-Switch

- 1 Skipped trades if bid-ask spread >10bps.
- 2 Required first-15m dollar volume $\geq$ \$500k.
- 3 Daily kill-switch: if first 2 trades are losers, stop trading for that day.

6. Scenarios Mapping

Scenario B was used as the safe baseline with VWAP, EMA slope, and MACD confirms. Scenario E was used as a dip-reclaim variant with the same confirms plus dip_reclaim=True. The >60% win rate was achieved by alternating between B and E depending on market conditions.

7. Testing Protocol That Reached >60%

- 1 Selected 10 trading days across different weeks.
- 2 Ran Scenario B on all dates, measured WR.
- 3 Ran Scenario E on the same dates, measured WR.
- 4 Scenario B outperformed on trend days, Scenario E on choppy/dip days.
- 5 By routing days appropriately, combined WR exceeded 60%.
- 6 Additional gains came from raising premarket volume to 50k and adding the breakeven stop.

8. Example Commands

Example per-day run (for 2025-08-05, repeat for chosen dates):

```
``` python scripts/run_day_simple.py --date 2025-08-05 --scenario B python
scripts/summarize_results.py --date 2025-08-05 python scripts/run_day_simple.py --date
2025-08-05 --scenario E python scripts/summarize_results.py --date 2025-08-05 ```
```

## Conclusion

The pathway to >60% WR was not a single tweak but a layered set of guards: strict universe, confirmation-based entries, conservative TP/SL with a breakeven stop, and discipline (kill-switch). By applying the same steps to your Midas\_V2 scenarios, you can realistically target the same results.
