

Adaptive Sizing Matrix (Draft for Midas_V2)

Generated: 2025-09-20 22:15

Catalyst Score (backbone)

- A-grade catalyst (score ≥ 2): eligible for larger sizing.
- B-grade catalyst (score = 1): smaller sizing; only included if Top-N needs filling.
- No catalyst: skip.

Confirm Alignment

- Strong alignment: EMA slope up, VWAP reclaim, MACD line > signal, 2–3 rising histogram bars, ≥ 3 rising green candles.
- Medium alignment: EMA+VWAP align, MACD line > signal but histogram flat.
- Weak alignment: only partial confirms; no size boost.

Example Risk Buckets (assuming \$50k account, base risk = \$5k per trade)

Catalyst	Confirms	Risk Size	Notes
A-grade	Strong (all aligns)	\$8–10k	“A+ setup” — larger bet, but never >2% equity.
A-grade	Medium	\$5–6k	Standard size.
B-grade	Strong	\$3–4k	Smaller bet, still worth taking.
B-grade	Medium	\$2–3k	Only if Top-N needs filling.
None	Any	Skip	No catalyst, no trade.

Guardrails

- Per-trade cap: never risk >2% of equity on a single trade.
- Daily stop: stop trading after \$–1,000 PnL.
- Drawdown throttle: if 3 consecutive losses, cut risk size by 50% for rest of day.

Implementation Path

- 1) Baseline config: keep fixed size (e.g. \$5k/trade) while you stabilize WR with Top-N + catalysts + confirms.
- 2) Phase 1 adaptive: add 2 buckets only — Normal (\$5k) vs. Large (\$8k) for A+ setups.
- 3) Phase 2 adaptive: expand to full matrix above once stable.
- 4) Future: connect expectancy calculations (PnL per setup type) to auto-tune the buckets.
