

Midas_V2 – v0.3.21 Comparison Log (Clarity Edition)

Side-by-side comparison with successful Cameron projects. Optimized layout for readability.

Category	Your Project (v0.3.21)	Successful Projects – Early Stage	Successful Projects – Mature Stage
Win Rate	~40–50% (some days no trades, poor pass rates)	35–45% (lots of junk trades pass filters)	60–65% baseline, sometimes 67%+ with router
Scenarios	B baseline (no trades Aug-05), with earlier references to D/E (63%/52%)	Usually only 1–2 scenarios tested	Router across 3–5 scenarios (D strict + E dip + B safe)
Confirm Logic	EMA/VWAP slope checks only; MACD rise_bars clarified but not enforced yet	Loose confirms, often just EMA or VWAP	MACD line + rising histogram (2–3 bars), EMA + VWAP slope, rising green candles
Volume Gates	Premarket ≥30k (baseline)	Basic PM volume checks	Premarket ≥30k + Opening RVOL gate ≥1.5× in first 10–15 minutes
Catalyst Logic	Catalyst universes for Aug-05/06/07 tested; A/B scoring not enforced yet	Catalyst awareness minimal	A-grade ≥2 required; B-grade only to fill Top-N
Candlestick Precision	1-minute candles (entries and confirm)	1-minute only	1-minute for trend confirm + 1-second for entries
Risk Management	Fixed per-trade risk; daily max loss not wired yet	Little/no risk logic	Risk-perceived sizing (bigger with A-grade + multiple confirms); daily loss cap (~\$1k)
Documentation & Versions	Strong Git discipline (v0.3.21 tagged, full logs & PDFs)	Ad-hoc, poor doc hygiene	Structured: roadmap, changelog, reproducible test flows
Profitability Target	Not reached; current runs show low pass rates	Negative or break-even	\$500/day baseline, \$50k/month stretch (with router + sizing)
