

Midas_V2 Roadmap — Driving Win Rate & Profitability

Objective: Push win rate beyond ~55% into the 60–65% range, while maintaining profitability (~\$500/day at ~60% WR).

1. Market Hygiene (reduce bad symbols)

- ■ Denylist active: drop .WS warrants, Chinese ADRs, known junk tickers.
- ■ Negative-headline filter (e.g. loss narrows, cut guidance, downgrade).
- ■ Catalyst strict A-only by default (no fallback unless explicitly passed).
- ■ Catalyst SAFE default topn=2 (take only 2 best-scoring A-grade symbols).
- Why this matters: Stops us from wasting trades on low-quality names.

2. Entry Confirmations (filter weak setups)

- Baseline (Scenario B): EMA confirm, VWAP confirm, MACD line above signal, 3 rising green candles (riseBars=3).
- Next upgrade: Add MACD histogram rising filter (macd_riseBars=2–3).
- Combine with green candles streak → double confirm on both price & momentum.
- Why this matters: Together they catch only the strongest moves.

3. Volume Gating (confirm participation)

- ■ Premarket volume min (30k baseline).
- ■ Gate minutes (don't trade until 10 minutes in).
- ■ Opening RVOL gate (min-rvol-open 1.5).
- Why this matters: High WR setups almost always coincide with unusual opening volume.

4. Trade Management (optimize risk/profit)

- ■ TP=2.0% / SL=2.5% in Scenario B.
- ■ Dynamic risk sizing (future).
- ■ Multiple trades per symbol (future).
- Why this matters: Protects account while allowing more upside when odds are high.

5. Testing & Validation

- ■ SAFE runners in place (simple & catalyst).
- ■ Summaries now self-documenting.
- ■ Next sweep: Aug-05 to Aug-15 with Scenario B strict + RVOL + MACD slope.
- Why this matters: Goal = stable 60%+ WR across wide sample.

6. Implementation Plan

- v0.3.21: A-only catalysts, riseBars=3, denylist, self-documenting summaries.
- v0.3.22: Catalyst SAFE default topn=2; Add macd_riseBars param.
- v0.3.23: Bake in RVOL gate; sweep Aug-05 → Aug-31.
- v0.3.24+: Adaptive sizing, multiple trades per symbol.

7. Summary — Recipe for Higher Win Rate & Profit

- Trade fewer, higher-quality symbols (A-only, Top-2).
- Confirm momentum both ways: rising candles and rising MACD histogram.
- Confirm participation: opening RVOL ≥ 1.5 .
- Manage risk tightly: TP/SL $\sim 2.0/2.5$, daily max loss \$1000.
- Test across wide sample: hundreds of days needed to prove $>60\%$ WR.

Next action

- Patch strategy.py to add macd_riseBars param.
- Adjust catalyst SAFE runner to topn=2 default.
- Tag v0.3.22.
