

Catalyst Continuation Cheat Sheet with Commands (v0.3.17)

Continuation Steps

1. ****Top-N Catalyst Universe per Day****
 - Build enriched universe (A backbone, B filler only).
 - Cap list to 3–5 tickers.
2. ****Apply Denylist****
 - Exclude Chinese ADRs, OTC, garbage tickers.
 - File: `data/denylist.txt`.
3. ****Set Active Universe****
 - Write final Top-N (after denylist) to `data/universe\_active.txt`.
4. ****Opening RVOL Gate****
 - Require $\geq 1.5 \times$ RVOL in first 10–15 min vs prev day.
5. ****Run Tests****
 - Run ****D_strict**** first, then ****B****, then ****E_dip****.
 - Test across ****August**** then ****September****, summarize WR/PnL.

Catalyst Scoring System

- ****3 (A-grade)****: Strong catalyst (earnings beat, FDA approval, big PR). Clean \$1–20, high RVOL. → Backbone.
- ****2 (B-grade)****: Moderate catalyst (analyst, partnership). Volume present. → Filler if Top-N too short.
- ****1 (C-grade)****: Weak/hype-only/unclear. → Exclude normally.
- ****0 / Denylist****: Exclude outright (Chinese ADRs, OTC, garbage).

Definition of "Wired Scenarios"

- “Wired” means ****implemented in code****, runnable end-to-end.
- Each scenario has parameter sets (EMA/VWAP, MACD, dip reclaim, TP/SL).
- Wiring = test harness for measurement, ****not**** validation or profitability.
- Low WRs highlight the need for catalyst, denylist, RVOL, and router logic.

Key Commands (One-Liners)

Catalyst Workflow

- Enrich with news:
`python scripts/enrich\_universe\_catalyst.py --date 2025-08-05 --out data/catalyst`
- Apply denylist + finalize active universe:
(built-in or wrapper logic) → outputs `data/universe\_active.txt`

Daily Runs (using active universe)

- Scenario D:
`python scripts/run\_day\_simple.py --date 2025-08-05 --scenario D`
- Scenario B:
`python scripts/run\_day\_simple.py --date 2025-08-05 --scenario B`
- Scenario E:
`python scripts/run\_day\_simple.py --date 2025-08-05 --scenario E`

Range Runs (Validation)

- D strict:
`python scripts/run\_range\_safe.py --start 2025-08-05 --end 2025-08-31 --scenario D`
- B baseline:
`python scripts/run\_range\_safe.py --start 2025-08-05 --end 2025-08-31 --scenario B`
- E dip:
`python scripts/run\_range\_safe.py --start 2025-08-05 --end 2025-08-31 --scenario E`

Results & Summaries

- Summarize single date:
`python scripts/summarize\_results.py --date 2025-08-05`
- Summarize range:
`python scripts/run\_range\_and\_summarize.py --start 2025-09-05 --end 2025-09-30 --scenario D`

Git – Tagging

- Tag:
`git tag -a v0.3.17-catalyst-rvol -m "v0.3.17: catalyst Top-N + denylist + RVOL gate + Aug/Sep validation"`
- Push:
`git push && git push --tags`

■■ ****Reminder****: To truthfully claim a WR >60%, results must be tested across ****hundreds of trading days****.
