

Addendum – Refresh Docs Script Corrections (v0.3.18)

Context

We switched from using `Docs/Refresh-Docs.ps1` to maintaining the **Python script** `Docs/refresh\_docs.py` as the canonical way to regenerate project documentation.

Corrections Made

- **Naming:** standardized on `refresh\_docs.py` (lowercase, underscore) instead of `Refresh-Docs.ps1`.
- **Invocation:**
 - Preferred:

```
...  
python .\Docs\refresh_docs.py  
...
```
 - PowerShell version still exists but considered legacy.
- **Functionality updates:**
 - Confirmed it regenerates `Docs/DEV\_GUIDE.md` (and auto-injects guides like `USER\_GUIDE.md` if configured).
 - Script was patched to:
 - Use repo-relative paths (no need for `--root .`).
 - Work cleanly in Python 3.13 environment.
 - Avoid stale outputs by overwriting existing guide files.

Decisions

- **Python script is now canonical.**
- **PowerShell script kept optional** for Windows-only helpers, but not the primary method.
- All future documentation updates and tagged versions will use the **Python refresh command**.

Next Steps

- Always run:

```
...  
python .\Docs\refresh_docs.py  
...
```

before committing + tagging a new version.

- Optional: remove `Refresh-Docs.ps1` in a later cleanup version (e.g., v0.3.20) once confident Python script covers all use cases.
