

Scenarios for Humans — A Quick Guide (Midas_V2)

This is a plain English overview of **Scenarios A–E** so anyone can understand what each one tries to do and how they differ.

Glossary (super short)

- **TP / SL** — take profit / stop loss (e.g., TP=+2.0%, SL=−2.5%).
- **EMA** — a moving average that gives more weight to recent price (tracks trend closely).
- **VWAP** — volume weighted average price (a “fair value” reference line).
- **MACD** — a momentum indicator (is the push actually gaining?).
- **Gate minutes** — how long we wait after the opening bell before a scenario is allowed to trade.

Scenario A — “Fast breakout scalper”

Idea: Jump early on strong momentum, grab a small profit quickly.

Behavior: Confirms **on** (EMA, VWAP, MACD), **gate** = 0 (no wait), **TP/SL** $\approx$ 1.2% / 2.7%.

Good when: the opener is very clean/strong. More sensitive to noise.

Scenario B — “Baseline, patient & confirm heavy”

Idea: Bread and butter setup; wait a bit, require strong confirms, aim for a modest win.

Behavior: Confirms **on** (EMA, VWAP, MACD), **gate** = 10 min, **TP/SL** $\approx$ 2.0% / 2.5%, needs some premarket volume (~30k).

Status: Our current baseline.

Scenario C — “Looser control / experiment”

Idea: Lighter confirmation sandbox (often for comparison, not production).

Behavior: **EMA on**, **VWAP off**, **MACD off**, **gate** = 0, **TP/SL** $\approx$ 1.2% / 2.7%.

Trade off: More signals, usually lower quality.

Scenario D — “Baseline’s earlier twin”

Idea: Like B, but allowed to start earlier to catch earlier pushes.

Behavior: Confirms **on** (EMA, VWAP, MACD), **gate** = 5 min, **TP/SL** $\approx$ 2.0% / 2.5%, premarket volume similar to B (~30k).

Use when: B feels late; D adds a few earlier entries.

Scenario E — “Dip reclaim (buy the bounce back)”

Idea: Don't chase the first move—wait for a **pullback**, then a **reclaim** (price loses a key level, then **proves** it can take it back).

Behavior: **Dip** **reclaim ON**, confirms **on** (EMA, VWAP, MACD), **gate = 15 min**, **rise_bars = 3**, higher pre **market volume** (~50k).

Use when: you want patience and proof before entries.

How to pick between them (simple rules)

- Start with **B** as the default.
- Try **D** if you want earlier entries (gate 5 vs 10).
- Use **E** when you prefer “wait for the reclaim” behavior.
- **A** and **C** are more aggressive / experimental (A is fast scalper; C is looser).

Today's working recipe

- Universe: **gap** $\geq 10\%$, price **\$1–\$20**.
- Catalyst mode: **A** **priority** + **B** **fill**, **Top** **N** = 3 (news fallback enabled).
- One trade per symbol (re **entry** optional in a later version).
