

Midas_V2 – v0.3.21 Full Log

1. Runs & Comparisons

Scenario B (Aug-05-2025)

```
```bash
python scripts/run_day_simple_SAFE.py --date 2025-08-05 --scenario B
```
```

- Result: No trades (TP=0, SL=0, Win%=0).

Catalyst Universes (Aug-05, Aug-06, Aug-07)

- Enriched universes with:

```
```bash
python scripts/enrich_universe_catalyst.py --date 2025-08-05 --limit 50
```
```

- Ran catalyst day runner:

```
```bash
python scripts/run_day_catalyst.py --date 2025-08-05 --scenario B --universe data\universe_active.txt
```
```

- Compared outputs side-by-side with standard `run\_day\_simple.py`.

Benchmarks (Recap)

- Scenario D strict (Aug 05→31): ~63% WR, +167.57 PnL.
- Scenario E dip-reclaim (Aug 05→31): ~52% WR, +145.03 PnL.
- Catalyst replay Aug-05:
 - D: N=6, WR=33.3%, PnL -47.68.
 - E: N=10, WR=50.0%, PnL +17.72.

2. Clarifications & Decisions

- ****topn=2**** → cap universe to top 2 gappers after filters.
- ****riseBars=3**** → checks MACD histogram bars (3 consecutive rising).
- ****Successful project practices****:
 - MACD line + histogram confirm.
 - Rising green candles (2–3 in a row).
 - Risk-perceived sizing (bet bigger on stronger setups).
 - Multi-strategy router (A–E).
 - 1-second candles for precision.

3. Documentation & Roadmap

- Built ****two-layer roadmap****:
 - Tactical: push v0.3.21, baseline Scenario B, add rising candles + histogram checks, test RVOL gate.
 - Strategic: risk-perceived sizing, router, 1-second candles, catalyst hygiene, multi-trade per ticker.
- Generated docs:
 - `Midas\_V2\_Roadmap\_Full.md/.pdf`

- `Midas\_V2\_Catalyst\_Log\_v0.3.21.md/.pdf`

4. Files Changed

- No core code changed today.
- New docs added: roadmap + catalyst log.

5. Next Steps

1. Push v0.3.21 with all docs.
2. Run Scenario B across Aug 05→31 as baseline.
3. Add rising green candle detection.
4. Enforce MACD histogram `riseBars=2-3`.
5. Add Opening RVOL gate ($\geq 1.5\times$).
6. Prepare v0.3.22 with these upgrades.
