

Midas_V2 – Achieving Over 60% Win Rate

Context

- **Project:** Midas_V2 (Ross Cameron–style small-cap backtester).
- **Goal:** Reach >60% win rate baseline in Scenario B.
- **Baseline Settings (Scenario B):**
 - Price: \$1–20
 - Gap: 10–40%
 - TP=2.0%, SL=2.5%
 - MACD confirm ON
 - EMA+VWAP confirm
 - Gate = 10 minutes
 - Min premarket vol = 30k

Lessons from Prior Projects

- **Multiple Trades per Ticker:** Earlier Cameron-style builds allowed >1 entry per symbol if setups repeated. This raised trade count *and* win rate.
- **1-Second Candles:** Switching from only 1-min bars to mixed 1-sec + 1-min improved precision (tighter pullback entries).
- **Strict Filters First:** We prioritized higher win % over more trades. Initial passes often had very few trades but >60% WR.
- **Adaptive Sizing (Later):** Higher odds setups risked more per trade (Kelly-lite). This boosted profitability once baseline WR was consistent.

Roadmap to 60% WR

1. **Scenario B Stabilization**
 - Run across multiple dates.
 - Confirm WR hovers ~55–60% with current TP/SL = 2.0/2.5.
2. **Dip-Reclaim Logic (Scenario E)**
 - Enable EMA/VWAP dip reclaim with MACD confirmation.
 - Adds safer entries after pullbacks → increased WR.

3. ****Strict Variant (Scenario D_strict)****

- Tighten gate to 5 minutes, keep SL at 2.5%.
- Designed to cut early chop and improve WR.

4. ****Multiple Trades per Symbol****

- Allow re-entry after fresh triggers.
- Boosts sample size while keeping setups consistent.

5. ****1-Second Candle Precision****

- Hybrid: entry logic on 1-sec, management on 1-min.
- Captures pullback → breakout with tighter stops.

6. ****Adaptive Sizing (Future)****

- Bet more on high-odds trades, cap risk per trade/day.
- Aim: improve profit without lowering WR.

Why Not 60% Yet?

- Current Scenario B is safe but plain.
- Missing: dip-reclaim + multiple trades + 1-sec precision.
- These were critical in past >60% projects.

Expected Timeline

- ****Weeks 1–2:**** Stabilize Scenario B, confirm ~55% WR.
- ****Weeks 3–4:**** Add dip-reclaim (Scenario E).
- ****Weeks 5–6:**** Enable multiple trades per ticker.
- ****Week 7+:**** Test 1-sec logic.
- ****Target:**** >60% WR baseline by ~2 months.
