

Video Analysis: Does this video help us? (MACD & Cameron-style context)

Short answer: partly. It reinforces MACD basics we already use (e.g., MACD line above signal), but it does not cover the Cameron-style “rising MACD histogram bars” rule we plan to add.

Helpful bits you can use now

Helpful bits you can use now:

- Keep MACD confirmation (MACD line > signal) as a bullish condition.
- The guidance is consistent with intraday momentum use (e.g., 1-5 minute charts) and avoiding confusion.
- Keep standard MACD defaults (12/26/9) so signals are consistent and comparable.

What it doesn't give you

What it doesn't provide (the gap we still plan to fill):

- No explicit rule like “2-3 consecutive rising MACD histogram bars before entry.”
- No small cap gap and go specifics (very large gappers, opening strength gates, 1 second entries)

What to do in our project today

What to do in our project today (stable build; no code edits):

- Keep ``macd_confirm: true`` (MACD line above signal).
- Enforce rising price candles via ``riseBars: 3`` (this is PRICE candles, not MACD histogram).
- Leave ``macd_riseBars: 0`` for now on the restored stable strategy (histogram rule not yet enforced).
- Proceed with August range runs for B and D to get clean WR/PNL baselines.

Plan for the histogram rule (later)

Plan for the histogram rule (later, in one clean drop-in):

- Add a small helper that checks MACD histogram rising N bars (N=2-3), and one gate in ``shouldEnter``.
- Ship as a single, tested file so there's no live patching or indentation/circular import issues.

Checklist

Quick checklist:

- 1) Config: ``macd_confirm=true`, `riseBars=3`, `macd_riseBars=0`` (for now).
- 2) Run: ``scripts\run_range_and_summarize.py`` for Scenario B, then D (Aug 05 → Aug 31).
- 3) Review results; consider tiny scenario only tweaks (e.g., `gate_minutes`) if needed.
- 4) Revisit MACD histogram rising as a single drop-in when ready.
