

■ Midas_V2 Checkpoint – v0.3.24 (2025-09-20 21:43)

■ What we did & fixes made 1. ****Top-N support restored**** - Patched `topgappers.py` so `--top N` now trims the *written* universe, not just the printout. - Patched `run\_day\_simple.py` so it accepts `--top` and forwards it to `topgappers.py`. - Default remains ****Top-50**** symbols if `--top` is not provided. - Verified `--top 12` works (Aug-07 run showed B=63.64% WR, E=68.75% WR).

2. ****Daily summary streaming**** - Rebuilt `run\_day\_simple.py` to ****stream `summarize\_results.py` output live to the console****. - Still saves the same summary file in `out/YYYYMMDD\<Scenario>\summary\_YYYY-MM-DD.txt`.

3. ****Range testing intact**** - Smoke-tested Aug-13→14 with Scenario B: ****57.78% WR, +92.32 PnL****. - Confirms that fixes did not break multi-day range runs.

4. ****Documentation updated**** - Updated the ****Test Commands Cheat Sheet**** to v0.3.24: - Clear explanation of default Top-50. - Examples for `--top 12`, `--top 20`. - Range examples included. - Delivered both ****Markdown**** and ****PDF****.

■ What to do next 1. ****Full August Baseline**** - Run Scenario B across Aug-05→31 without `--top` (default Top-50) to reconfirm baseline. - Analyze with `analyze\_range\_explained.py`.

2. ****Top-N Range Test**** - If baseline looks weak, run Scenario D (and/or B) with `--top 12` across Aug-05→31 to measure improvement.

3. ****Validate July**** - Once August is stable (≥ 55 –60% WR, flat/positive PnL), rerun the same scenario on July dates.

4. ****Tag in GitHub**** - Commit code & updated docs. - Tag as `v0.3.24` with message: ****“Top-N (--top) support restored, daily summaries streamed to console, range flow confirmed, docs updated.”****
