

Midas_V2 — v0.3.6-prev-trading-day-fix (Sep 2–5 window) — Results & Next Steps

This version documents a **single, surgical change** to restore your fast workflow and fix the Sep 2 holiday edge case, plus the exact commands we ran and what we observed.

What changed (tiny, safe)

- **topgappers.py**: now calls your existing `scripts/prev_trading_day_polygon.py` to resolve the **prior trading day** (not prior calendar day).
 - **Arg compatibility**: accepts/ignores extra args (e.g., `--session`) so `run_day_simple.py` works unchanged.
 - **Nothing else changed**: same outputs, same defaults, same strategy code and scripts.
- Why:** Sep 1, 2025 was Labor Day. Using the prior *calendar* day made Sep 2 look broken. Calling your helper guarantees Sep 2 uses **Aug 29** as “previous trading day.”

Commands we used (your normal flow)

Single-day checks (D and/or E)

```
``powershell
```

Run a single day

```
python scripts\run_day_simple.py --date 2025-09-02 --scenario D
python scripts\summarize_results.py --date 2025-09-02
...
```

Short range (auto-rebuilds summary)

```
``powershell
```

```
python scripts\run_range_safe.py --start 2025-09-02 --end 2025-09-05 --scenario D
python scripts\run_range_safe.py --start 2025-09-02 --end 2025-09-05 --scenario E
```

View and analyze rebuilt summaries

```
python scripts\show_latest_range.py --root out\auto --scenario D
python scripts\analyze_range_explained.py --csv
out\auto\range_summary_20250902_20250905_D.csv

python scripts\show_latest_range.py --root out\auto --scenario E
python scripts\analyze_range_explained.py --csv
out\auto\range_summary_20250902_20250905_E.csv
...
```

Results we saw (September 2–5, 2025)

D (continuation; strict)

Per-day (from rebuilt range summary):

- **2025-09-02**: trades **3**, **0/3**, WR **0.00%**, PnL **-30.79**

- **2025-09-03**: trades **3**, **0/3**, WR **0.00%**, PnL **-33.04**
- **2025-09-04**: trades **7**, **2/5**, WR **28.57%**, PnL **-76.87**
- **2025-09-05**: trades **5**, **1/4**, WR **20.00%**, PnL **-22.83**

Totals (Sep 2–5): **18 trades**, **3/15**, WR **16.67%**, PnL **-163.53**.

E (dip-reclaim) — same span

Per-day (from rebuilt range summary):

- **2025-09-02**: trades **10**, **4/6**, WR **40.00%**, PnL **-24.18**
- **2025-09-03**: trades **4**, **1/3**, WR **25.00%**, PnL **-15.06**
- **2025-09-04**: trades **3**, **0/3**, WR **0.00%**, PnL **-27.61**
- **2025-09-05**: trades **3**, **0/3**, WR **0.00%**, PnL **-18.66**

Totals (Sep 2–5): **20 trades**, **5/15**, WR **25.00%**, PnL **-85.51**.

> **Interpretation:** The software is fast again; the holiday edge is fixed. This particular week was simply unfavorable for our momentum profiles (both D and E).

What to do next (pick one)

A) Move to a cleaner window (recommended):

Run **Oct 1–5** for D (and optionally E) to validate in a fresh market regime.

```

powershell
python scripts\run_range_safe.py --start 2025-10-01 --end 2025-10-05 --scenario D
python scripts\run_range_safe.py --start 2025-10-01 --end 2025-10-05 --scenario E

```

B) Tiny hygiene (for choppy weeks, no redesign):

For a given day, exclude obvious noisy tickers (warrants/units/leveraged ETFs) right after gappers
just for that run, then proceed as normal.

```

powershell
python scripts\topgappers.py --date 2025-09-02
(Get-Content data\samples\universe_sample.txt) ^
| Where-Object { $_ -notmatch '\.WS$|\.U$|UVXY|SOXS|VIXI|FNGD|SSG|TSLL|TSLT' } ^
| Set-Content data\samples\universe_sample.txt
python scripts\run_day_simple.py --date 2025-09-02 --scenario D
python scripts\summarize_results.py --date 2025-09-02

```

C) Keep September D only, archive, and proceed to router (later):

When ready, implement the **v0.3.6 hybrid-router** (D>E precedence, one position per symbol, risk split) as discussed, but only after validating another clean window.

D) Regression check on known good August days (no regressions):

run the August days that historically worked to confirm nothing regressed after the tiny fix.

```
```powershell
```

### **D\_strict sanity**

```
python scripts\run_day_simple.py --date 2025-08-06 --scenario D
```

```
python scripts\summarize_results.py --date 2025-08-06
```

### **E\_dip sanity (if applicable in your current branch/settings)**

```
python scripts\run_day_simple.py --date 2025-08-22 --scenario E
```

```
python scripts\summarize_results.py --date 2025-08-22
```

```
```
```

Version & tagging

This is a small, documented step on top of your prior tag (no redesign). If you want to tag it:

```
```powershell
```

```
git add scripts/topgappers.py
```

```
git commit -m "Fix: topgappers uses prev_trading_day_polygon (arg compatible); no behavior change"
```

```
git tag -a v0.3.6-prev-trading-day-fix -m "Holiday edge fixed; software fast again; Sep 2–5 results recorded"
```

```
git push; git push --tags
```

```
```
```

Prepared on 2025-09-06.
