

# Midas\_V2 — Future Plans (Parking Lot) — v0.3.9 draft

Goal: Maintain  $\geq 60\%$  WR baseline; target  $\sim \$500/\text{day}$  using Cameron-style setups with safe risk controls.

## 1) Immediate (this week)

- Re-run **September** regression with Scenario **D** (done if already ran), then **E**.
- Keep using ``run_range_and_summarize.py`` (no new scripts) and tag stable checkpoints.
- Use ``.env`` autoload + PYTHONPATH fixes (v0.3.8 tag) for runners.
- Optional hygiene before backtests: exclude warrants/units/leveraged ETFs from ``universe_sample.txt`` (see filter script).

## 2) Short-term (next)

- **Opening RVOL gate** (first 10–15 min vs previous day, default  $\geq 1.5$ ). Flag: ``--min-rvol-open`` (off by default).
- **Scenario D\_strict** remains baseline: MACD on, gate=5, min\_pm\_vol=30k, TP/SL 2.0/2.5, EMA+VWAP confirm.
- **Scenario E\_dip** (dip to EMA/VWAP + reclaim + MACD rising). Default: gate=15, riseBars=3, TP/SL 2.0/2.5.
- **Universe hygiene baked into topgappers**: filter .WS, .U, UVXY/UVIX/VIXI/SOXS/SSG/FNGD etc.

## 3) Medium-term

- **Multi-trade per ticker** option (cap per symbol; one position at a time). Safe default = off.
- **1-second entries** (for reclaim/confirmation) with guardrails; minute data remains canonical for summaries.
- **Adaptive sizing (expectancy/Kelly-lite)**: raise size when odds better; caps on per-trade, per-day drawdown.
- **Scenario router (D→E precedence)**: one position per symbol at a time; shared risk budget.
- **Broker adapter** layer (broker=alpaca|lightspeed via config).

## 4) Risk & Ops

- Per-trade risk baseline:  $\sim \$50$  (adjust in config/risk). Daily max-loss cap:  $\sim \$1,000$ .
- EOD flatten always on; detailed WHY logs for entries/exits; summarize daily PnL and WR.
- Keep ``.env`` local; ``.env.example`` tracked as a template (optional).

## 5) Versioning workflow

- Tag every working milestone (e.g., v0.3.8-2025-09-07-envfix). Keep one-line commands, no ``&&``/pipes.
- Store Docs under ``Docs/versions/<n>``. version <tag name>/...` when convenient.

## 6) Concrete next tags (proposed)

- **v0.3.9** — RVOL gate flag + hygiene in topgappers (off by default). Range regression for September.
- **v0.4.0-sizing** — Adaptive sizing (expectancy/Kelly-lite) with strict caps.

- **v0.4.1-sec-entries** — Optional 1-second entry module (guarded) + per-symbol multi-trade toggle.
- **v0.5.0-router** — Scenario router D>E, shared risk budget, one position per symbol.
- **v0.6.0-broker** — Broker adapter abstraction (alpaca/lightspeed via config).

## 7) Cameron alignment (recap)

- Price band 1–20 USD; gap 10–40%; min pre-market volume 30k+; prefer news catalyst; avoid China ADRs where desired.
- Confirm with EMA(9), VWAP, MACD rising (rise\_bars 2–3). Target TP  $\approx$  2.0%, SL 2.5–4.0% depending on profile.

## 8) Commands (pure Python; no PowerShell chaining)

- Single day: ``python scripts\run_day_simple.py --date YYYY-MM-DD --scenario D``
- Range: ``python scripts\run_range_and_summarize.py --start 2025-09-01 --end 2025-09-30 --scenario D``
- View: ``python scripts\view_results.py --date YYYY-MM-DD --scenario D --preview 20 --top 5``

(Keep this file in ``Docs/versions/6. version v0.3.9 plans/`` when you're ready.)
