

Profitability Playbook — Cameron + Additions (v0.3.9 draft)

Date: 2025-09-07

Goal: Raise realized profitability while preserving (or improving) baseline win rate and keeping drawdowns small.

0) TL;DR (what actually helps most)

1. Universe hygiene + opening RVOL gate → fewer low quality trades, better PnL stability.
2. D_strict + E_dip together → D is the safety anchor; E adds selective high R:R wins.
3. Selective 1 second confirmation at the trigger (break/reclaim) → fewer false breaks on choppy opens.
4. Risk based position sizing (fixed \$R per trade, strict caps) → smoother equity, shallower drawdowns.
5. Optional add on scenarios (ORB, VWAP reclaim fade, BOPB, Parabolic reversal, MDBO, News scalps) — gated by RVOL/trend.

1) Cameron baselines you're using

1.1 Scenario D_strict (anchor)

- **Intent:** conservative momentum breakout with confirmations.
- **Typical guardrails:** gate=5 min, min_pm_vol≥30k, price \$1–20, gap 10–40%, EMA+VWAP confirm, MACD rising (riseBars≈2), TP=2.0%, SL=2.5%.
- **Observed (Aug):** ≈63.29% WR, +167.57 PnL over 2025-08-05→2025-08-31 (79 trades, 50/29 W/L).

1.2 Scenario E_dip (complement to D)

- **Intent:** micro pullback / dip to EMA or VWAP, then **reclaim** with MACD rising.
- **Typical guardrails:** gate=15, riseBars=3, min_pm_vol≥50k, TP=2.0%, SL=2.5%, reclaim_ref=EMA.
- **Observed (Aug):** ≈52.07% WR, +145.03 PnL (lower WR than D, but strong winners).

1.3 Hygiene & RVOL

- **Hygiene filters:** exclude warrants/units/leveraged ETFs (e.g., symbols ending .WS, .U, UVXY/UVIX/VIXI/SOXS/SSG/FNGD), avoid China ADRs if desired.
- **Opening RVOL gate:** ratio of first 10–15 min volume vs prior day ≥ 1.5 (tunable). Improves quality; keep off by default until after regression.

2) Add on strategies (outside Cameron) that can lift PnL

Below: Preconditions → Entry → Exit/Risk → Knobs → Wiring

2.1 Opening Range Breakout (ORB) — add only with RVOL/trend

- **Pre:** price \$1–20, gap≥5–10%, RVOL_open≥1.5, EMA slope up, (opt) MACD line>signal.

- **Entry:** break/close above 1–5 min opening range; optional 1 sec hold above level.
- **Exit/Risk:** SL at OR mid/low or ATR fraction; TP 1.5–2.5% or EMA trail.
- **Knobs:** OR minutes {{1,3,5}}, RVOL gate {{off,1.2,1.5,2.0}}, TP/SL grid.
- **Wiring later:** scenario F_orb with orb_minutes, min_rvol_open, ema_slope_up, macd_confirm.

2.2 VWAP reclaim “fade” (counter trend, conservative)

- **Pre:** extension from VWAP (e.g., +0.2–0.5%), mid day, no fresh spike.
- **Entry:** wait for tag + reclaim of VWAP; MACD upturn on entry bar.
- **Exit/Risk:** tight SL just beyond reclaim; TP 1.0–1.5% or VWAP trail.
- **Knobs:** reclaim tolerance bps, time of day gate.
- **Wiring:** G_vwap_fade with vwap_reclaim=True, fade_mode=True, gate_minutes≥15.

2.3 Parabolic reversal (exhaustion → reclaim)

- **Pre:** 3+ stacked wide greens / far above EMA/VWAP; volume climax/wicks.
- **Entry:** pullback to EMA/VWAP, then reclaim with MACD histogram turning up.
- **Exit/Risk:** SL a few ticks below reclaim low; TP 1.5–2.5% or EMA trail.
- **Knobs:** extension multiple, reclaim_ref, MACD rise bars.
- **Wiring:** H_parabolic_rev with extension_mult, reclaim_ref, riseBars.

2.4 Breakout Pullback / Retest (BOPB)

- **Pre:** clear pivot (≥3 touches), EMA(9) > VWAP, trend up.
- **Entry:** break → pullback → tag level → small reversal close above level.
- **Exit/Risk:** SL under retest low; TP 2–3% or next shelf.
- **Knobs:** min touches, buffer bps, time cap.
- **Wiring:** I_bopb with pivot_retest=True, buffer_bps, time_cap_min.

2.5 Multi Day Breakout (MDBO) — intraday trigger at daily level

- **Pre:** daily resistance within 1–2% above open; RVOL≥1.2; clean tape.
- **Entry:** intraday break + hold above PDH/range high; EMA slope up.
- **Exit/Risk:** SL back inside level; TP 2–3% or partial + trail.
- **Knobs:** daily buffer bps, intraday hold seconds.
- **Wiring:** J_mdbo with daily_breakout_ref, buffer_bps, hold_seconds.

2.6 News/PR momentum scalps (NPR)

- **Pre:** headline/spike proxy via volume/range σ .
- **Entry:** first reclaim after spike with EMA cross up + MACD line > signal; 1 sec confirm helpful.
- **Exit/Risk:** tight SL; TP 0.8–1.5%; flat by EOD.
- **Knobs:** spike thresholds, confirm seconds, TP/SL.
- **Wiring:** K_news with spike_filter=True, confirm_seconds=3–5.

3) Cross cutting boosters

3.1 1 second confirmation (selective)

Use seconds only at the trigger (break/reclaim hold for 3–5s). Lowers false breaks, slightly fewer fills.

3.2 Risk based position sizing (documented; implement later)

- Keeps losses consistent (e.g., \$50/trade). Improves equity smoothness and often expectancy.
- See RISK_BASED_POSITION_SIZING_GUIDE_v0.3.9-draft.pdf for math, caps, and rollout plan.

3.3 Scenario router (D→E precedence; one position per symbol)

Avoids double-dipping capital on the same symbol; improves risk use without changing signals.

4) Rollout plan (safe sequence)

- 1) September regression — D_strict using your classic run_range_and_summarize.py.
- 2) Run E_dip on the same range; compare WR/PnL/expectancy.
- 3) Turn on hygiene filter + RVOL gate (off → on) and rerun; expect fewer losers.
- 4) Optional: add 1-second confirm on the trigger only; rerun.
- 5) When stable, adopt risk-based sizing (fixed \$R; strict caps).
- 6) Trial one add-on scenario (most often ORB with RVOL gate) as F_orb gated by trend/RVOL.

Tag every stable checkpoint so you can always restore in one command.

5) Metrics to monitor

- WR, Expectancy, Total PnL, Max DD, Avg hold time, Max favorable/adverse excursion.
- Per-symbol overlap between scenarios; router “skips” (if/when enabled).
- Trade count vs WR after hygiene/RVOL/seconds changes.

6) Commands (pure Python; no chaining)

Single day

```
python scripts\run_day_simple.py --date 2025-08-05 --scenario D
```

```
python scripts\summarize_results.py --date 2025-08-05
```

Range (August/September examples)

```
python scripts\run_range_and_summarize.py --start 2025-08-05 --end 2025-08-31 --scenario D
```

```
python scripts\run_range_and_summarize.py --start 2025-09-01 --end 2025-09-30 --scenario D
```

```
python scripts\show_latest_range.py --root out\auto --scenario D
```

Viewer

```
python scripts\view_results.py --date 2025-09-02 --scenario D --preview 20 --top 5
```

7) Risks & gotchas

- ORB and counter-trend fades can underperform in chop; keep RVOL/trend gates.
- Seconds data adds slippage risk; use only at the trigger.
- Don't turn on multiple new features at once; A/B each change.

8) Where to file this

Docs\versions\5. version v0.3.8-2025-09-07-envfix\ or
Docs\versions\6. version v0.3.9 plans\ (your choice).
