

Scenario Integration Roadmap

Objective: Combine scenario logic safely while preserving baseline performance.

Rules of engagement

- One open position per symbol at a time across scenarios.
- Precedence: D (strict) > E (dip reclaim). If D is in a trade, E skips the same symbol until flat.
- Shared risk budget; per-trade risk caps; daily max loss cap enforced globally.

Steps

- 1) Baseline D across month (done for August; run September).
- 2) Validate E_dip independently across month.
- 3) Introduce router with dry-run logging (no live trades) to verify de-duplication and precedence.
- 4) Turn router on with conservative risk split (e.g., 70% D, 30% E).

Metrics to monitor

- WR, Expectancy, Avg hold time, Max adverse excursion, Max favorable excursion.
- Per-symbol overlap frequency; router “skips” count; drawdown under split vs solo scenarios.
