

Midas Project Audit Report

Date: 2025-09-07

Version Context: v0.3.7-cleanup

Introduction

This report compares the **Midas_V2** project with typical Cameron-style trading bot projects. It highlights strengths, differences, and areas where Midas is more organized and professional.

1. Version Control

- **Typical projects:** Rarely use Git or only keep a single repo snapshot. Tags are infrequent.
- **Midas:** Every stable checkpoint is tagged (e.g., v0.3.4-scenarioDgoodresults, v0.3.5-hybrid-baseline, v0.3.7-cleanup).
- **Audit Result:** ■ Far superior. Midas maintains a full version history and rollback capability.

2. Cleanup & Archiving

- **Typical projects:** Old scripts are deleted outright, often without history. Clutter accumulates quickly.
- **Midas:** Uses `\_archive\_unused/YYYYMMDD/` to store unused scripts, preserving history without clutter.
- **Audit Result:** ■ Professional-level practice. Safer and more reversible than most.

3. Documentation

- **Typical projects:** Scattered notes, sometimes in text files or not at all. Difficult to trace decisions.
- **Midas:** Dedicated `Docs/versions/` folder with MD + PDF for every milestone (cleanup notes, sanity checks, workflow principles).
- **Audit Result:** ■ Exceptionally organized. Provides a living history of decisions.

4. Scenario Structure

- **Typical projects:** Strategies coded inline with little modularity. Often one set of rules is tweaked endlessly.
- **Midas:** Clear separation into scenarios A–E, each testable independently. Future router planned.
- **Audit Result:** ■ Strong modular design. Allows fair comparison and later hybridization.

5. Risk & Guardrails

- **Typical projects:** TP/SL and risk rules are inconsistent or missing. Often no daily stop-loss cap.
- **Midas:** TP/SL defined per scenario, daily stop-loss cap planned, guardrails (VWAP, EMA, MACD, RVOL) clearly documented.
- **Audit Result:** ■ More disciplined and realistic than most.

6. Future Planning

- **Typical projects:** Features added ad hoc, often breaking old functionality. Little thought for broker portability.
- **Midas:** Roadmap explicitly defers hybrid router, adaptive sizing, and broker abstraction until scenarios are stable.
- **Audit Result:** ■ Forward-thinking. Avoids premature complexity.

Conclusion

The **Midas_V2** project is significantly more organized and professional than the majority of Cameron-style trading projects.

- Frequent tagging and archiving give it resilience.
- Documentation makes it auditable and teachable.
- Scenario modularity allows scientific testing.
- Guardrails and deferred features reflect discipline.

Overall Rating: ★★★★★

Midas stands out as a model of good practice in Cameron-style system building.

Recommendation

Maintain this discipline going forward:

- Tag all major checkpoints.
- Continue producing MD + PDF docs in `Docs/versions/`.
- Resist rushing advanced features until the baseline is stable.
